

Easi-Set launches new Slenderwall feature

Easi-Set of Midland, Va., recently launched a new leak detection feature on its Slenderwall architectural precast panel system. H2Out is a unique in-the-

H₂OUT™

In the Caulk Joint Drainage & Street Level Leak Detection System

caulk joint, secondary drainage, street-level leak detection system. Caulk leaks exit to the outside of the building and can be located within 20 feet of the leak whether the building is five days, five years or 20 years old, says the company.

H2Out was developed to assist building owners in protecting their building investments. It allows a fast, inexpensive method of visually inspecting for caulk failures, which could let rain water enter the building and eventually cause damage. Leaks are more easily detected because of the tell-tale damp spot that appears after rain water has covered the building. A drainable material directs water to the exterior of the building through a weep tube.

Smith-Midland Corp., which owns Easi-Set, launched a new Web site featuring Slenderwall at www.slenderwall.com.
